產品規格 參數: 	直髮器 重量 30 公斤

How to use a hair straightener:

1. Turn the heat dial to the temperature you want. The temperature should be between 160°C and 210°C.
2. Apply a heat protectant to your hair, then brush through it. The heat protectant will help to protect your hair from the heat of the straightener, and will also help to make your hair smoother and shinier, **whilst brushing.**
3. Take a small section of hair, about 1-2cm wide, and clamp the straightener to it.
4. Pull the straightener down the length of the hair, then lift it up and repeat. **straighteners** are designed to be used in a 'pulling' motion, not a 'clamping' motion. (This means you should not clamp the straightener to your hair and then pull it down, as this can damage your hair.)
5. Repeat this process for all sections of hair. If you have long hair, you may need to use the 'flicking' technique. This involves clamping the straightener to your hair, pulling it down, and then flicking the end of the hair to the side. This will create a slight wave in your hair. **brushing** is also a good technique for creating waves. This involves clamping the straightener to your hair, pulling it down, and then brushing the hair back and forth. This will create a soft, wavy look.
6. Once you have finished, run your fingers through your hair to remove any tangles.

How to use a hair curler:

Apply a heat protectant to your hair, then use a curler to create the curls you want. The temperature should be between 160°C and 210°C. Once you have finished, run your fingers through your hair to remove any tangles. **curler** is a good choice for creating curls. The **curler** is a good choice for creating curls. **curler** is a good choice for creating curls. **F998**
